

README

在Orange's实现源码chapter6 r基础上修改而成，在 ubuntu 36 位下运行

修改内容

1. Makefile:

添加 run 指令直接运行

CFLAGS后添加 `-fno-stack-protector` 避免 `__stack_chk_fail` 报错

CC后添加 `-w` 忽略 gcc 编译 warning 警告

2. proc.h

1. 定义信号量结构体 semaphore

```
1  typedef struct semaphore{
2      int value;//信号量值
3      PROCESS *list[20];//等待队列
4  }SEMAPHORE;
```

2. 结构体 s_proc 中添加数据sleep_tick 和 blocked用于控制睡眠

3. 为 TestD(), TestE(), TestF() 添加相关代码

4. 添加 ifndef 避免重定义

3. const.h

1. 共定义了 6 个系统调用，修改 NR_SYS_CALL为 6

4. proto.h

1. 添加对 proc.h 的引用

2. 添加 main.c, proc.c, syscall.asm 新定义的方法调用

5. global.c

1. 为TestD(), TestE(), TestF() 添加相关代码

2. sys_call_table 中添加 sys_sleep, sys_my_disp, sys_P, sys_V, sys_my_disp_int

6. syscall.asm

1. 增加 sleep, my_disp, P, V, my_disp_int

2. 增加 my_disp 方法实现颜色输出

7. kernal.asm

1. 把传入参数压栈

8. proc.c

1. 修改 schedule() 方法

2. 添加 sys_sleep()

3. 添加 sys_my_disp() 方法实现彩色打印

4. 添加 sys_P()方法

5. 添加 sys_V()方法
6. 添加 sys_my_disp_int() 方法实现打印数字
9. main.c 主要功能实现
 1. 进行待用数据定义
 2. 在 kernel_main() 进行了各项数据的初始化
 3. TestA(),TestB(),TestC()为读者进程, TestD(),TestE()为写者进程, 都写了两个分别为读者优先和写者优先, 运行时注释掉一个, TestF 为普通进程实现

运行截图

1. 读者优先, 最多 3 个读者同时读

```
Bochs x86-64 emulator, http://bochs.sourceforge.net/
A: B: CD
USER Copy Paste Snapshot CONFIG Reset suspend Power
F:READING (0x3 people)
A:reader has finished.
F:READING (0x2 people)
B:reader has finished.
C:reader has finished.
D:writer starts to write.
F:WRITING
F:WRITING
F:WRITING
F:WRITING
D:writer has finished.
E:writer starts to write.
F:WRITING
F:WRITING
F:WRITING
F:WRITING
E:writer has finished.
A:reader starts to read.
B:reader starts to read.
C:reader starts to read.
F:READING (0x3 people)
F:READING (0x3 people)
A:reader has finished.
F:READING (0x2 people)
```
